

## Conserving Water When the Reclaim Is in Bypass

This document will give instructions on how to conserve water in the wash when the reclaim is in bypass. This is important to follow, especially for sites with two-inch incoming lines to prevent city line erosion from excessive water demand.

By doing the following steps you limit your additional freshwater usage to 20 GPM when reclaim is in bypass which will prevent the city line erosion for two-inch lines.

### **What you need to do:**

For this you will need to go into your HMI on your iPad and disable the following functions: Belt Flush, Pre-blast, and HPP2 to disable your rear facing wheel blasters.

By doing so you will turn off all reclaim functions besides your front facing wheel blasters. This will prevent those functions from pulling fresh water in place of reclaim while the system is in bypass thus eliminating the worry of erosion for two-inch incoming city lines.
